

**IN THE CLAIMS:**

Please cancel claims 2-12 and add claims 13-15 as follows:

1           13. A device comprising:  
2               a power unit;  
3               means for accepting an instruction for controlling said power unit from a managing  
4       computer via a network;  
5               a power unit controlling controller for converting said instruction into a power unit  
6       control signal; and  
7               means for performing control of said power unit based on said power unit control  
8       signal from said power unit controlling controller.

Sub 14. A device according to claim 13, wherein said power unit controlling controller  
2       comprises:  
3               means for detecting a result and state of power unit control for said device; and  
4               means for transmitting said detected result and state from said detecting means to said  
5       managing computer via said network.

F1 15. A device according to claim 13, wherein said device includes at least a server to be  
2       managed.
